Benefits of Underground Utility Locating

Why do we use line locators and why do we have utility locates done prior to ground disturbance? The best answer is 'damage prevention.' Corrpro has been a leader in line locating for more than two decades. Utility line locates are completed prior to digging to prevent damage to persons, property and the environment. Corrpro advocates the best practices and job procedures for getting the job done right and getting it done safely.

The vast network of public and private underground infrastructure in use today is constantly growing. For all parties concerned, having a utility locate completed is one of the first steps in due diligence.

The use of locators on a per job basis is not a new concept. Locators were primarily used in the past where facilities were known to exist. For a period of time it was accepted practice to run the risk of hitting a buried facility as opposed to having it marked. Today, that is not an acceptable practice and Corrpro plays a prevalent role in safely providing this service.

Corrpro – The Underground Utility Locating Experts

Corrpro has highly trained locate technicians and the latest in utility locating equipment to provide complete and accurate locates, including a Sonde for locating sewer lines and empty conduits. All Corrpro locate technicians are fully trained and carry a wide variety of safety certifications. Corrpro also provides fully equipped vehicles and ATVs.
